

# Job 547202 • Training improved feature distances, with weak class conditioning

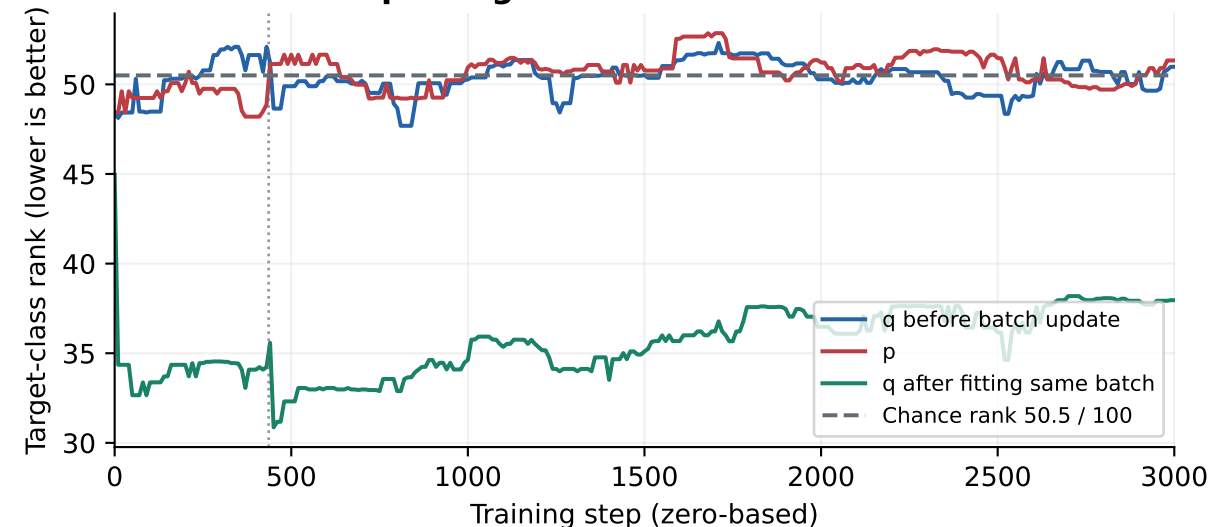

## q spreads its probability across almost all classes

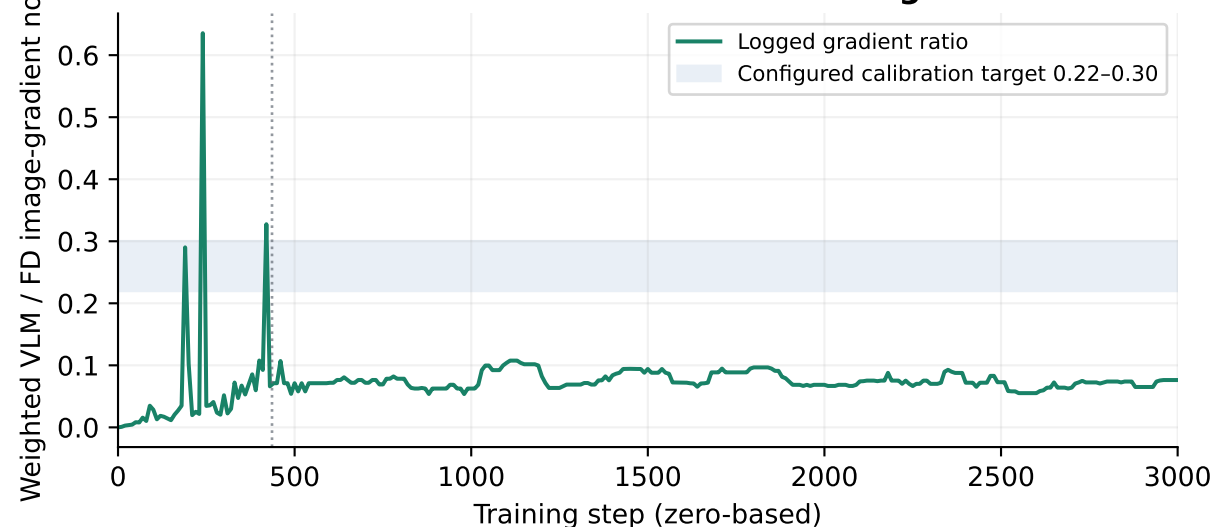

## Actual counts from saved diagnostic windows

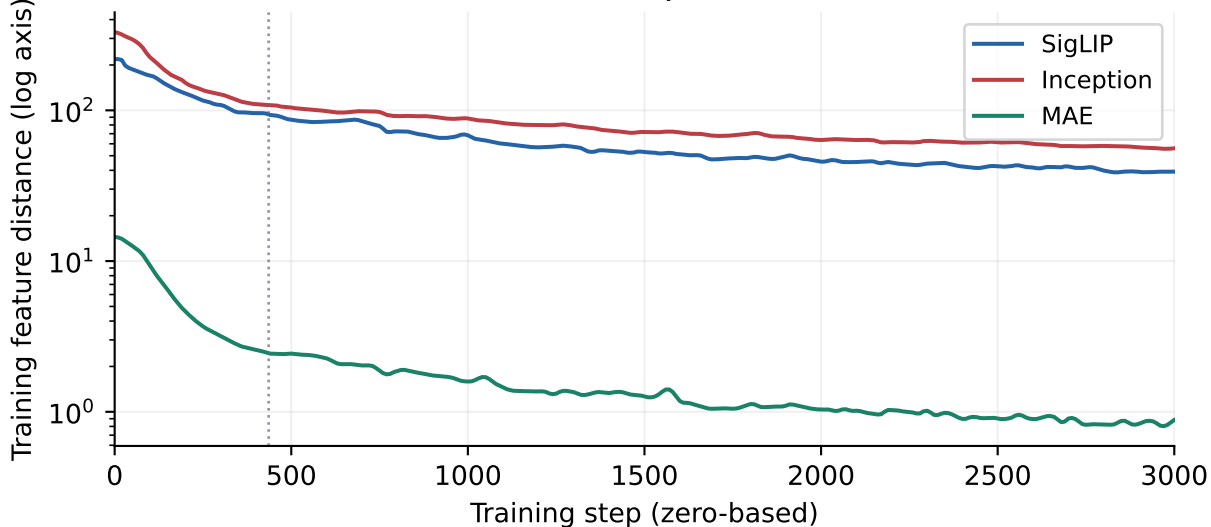

## Same-batch q fitting does not transfer to fresh batches

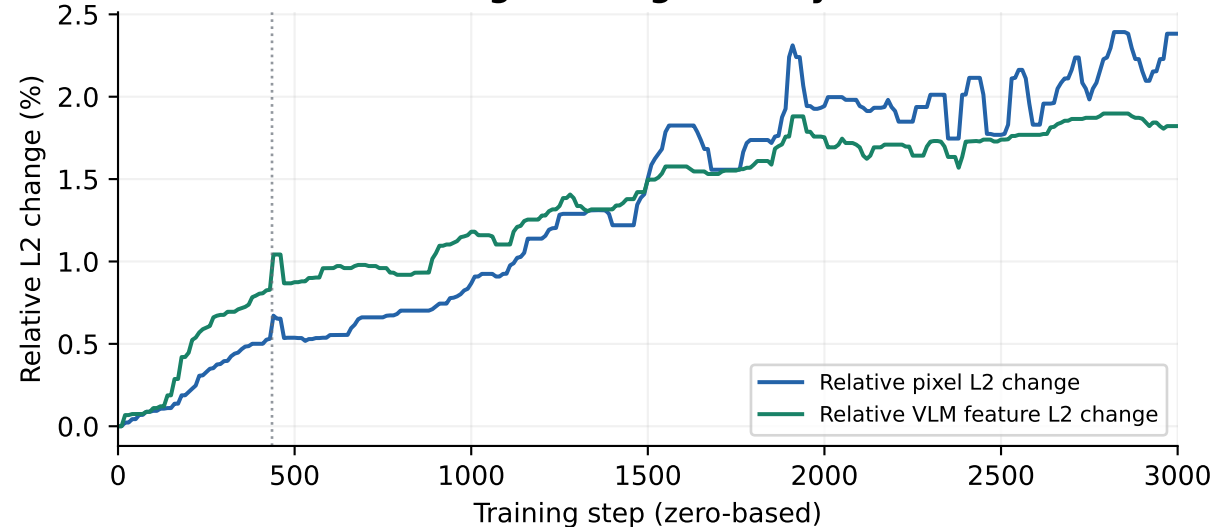

## Late-run median ratio $\approx 0.072$ at weight $1e-5$

## Feature distances decrease; no held-out FID was run

## Fixed-noise images change weakly with the class

Diagnostic curves show saved rolling medians; after resume, gradient ratio also became a 20-diagnostic median.  
Accuracy panel uses true count-weighted windows: 672 images at step 500; 4800 images at each later point. Probe uses all 1000 classes.
